

ABSTRACT

An apparatus and method for cleaning a paint roller, wherein the present apparatus is adapted to receive and substantially enclose a paint-soiled paint roller cover for the effective cleansing thereof via a pressurized cleaning fluid, and wherein the present invention permits the paint roller cover to remain on the wire frame of the paint roller assembly during the cleaning process; and wherein the present invention further effectively shields the user from paint spray (i.e., paint-soiled water or other solvent) during the cleansing process; all while providing for the effective drainage and containment of paint-soiled water leaving the paint roller cover during the cleaning process, thus reducing the quantity of cleaning fluid utilized and the duration of the overall cleaning process.
